Abstract of JP60206412

PURPOSE: To perfectly and simply repair the adhesion inferior place of the end surface of a module, by using a photocurable material, wherein a photopolymerizable resin composition layer is provided to a transparent support, as a repairing member and transferring the photocurable resin thereof to the injection resin end surface.

CONSTITUTION: A photocurable material 1, wherein a photopolymerizable resin composition layer 11 is provided on a transparent support 12 comprising a polyethylene sheet, is closely adhered to the end surface 2 of a module under heating and, thereafter, exposed to ultraviolet rays or visible light. The photopolymerizable resin composition layer 11 on the injection resin parts 21 of the end surface 2 is cured by photopolymerization to be strongly adhered to the injection resin parts 21. Because there is no adhered substance in the opening parts 22 of the end surface and oxygen in air present in the opening parts 22 functions as a photopolymerization inhibitor, when the transparent support 12 is peeled off after exposure, the photocured resin on the opening parts 22 is peeled off in a state held to the transparent support 12.
